(I) or the nucleic acid (II) encoding (I), are used to induce an immune response against tumor cells, so are useful for treatment or prevention of tumors, in conjunction with other tumor therapies. In particular (II) is used in gene therapy or for in vitro transfection or transformation of cells (particularly antigen-

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Interior interior is a composition (CPP) associated with a mattigen or antibody. Also included are (1) a vaccine comprising (1), CPP associated with an antigen or antibody. Also included are (1) a vaccine comprising (1), CPP associated with an antigen, and a pharmaceutically acceptable carrier and (2) preparing a composition for a disease, by providing (1) and CPP associated with an antigen for disease, and introducing the antigen-associated CPP to (1), where antigen enters into the cell. The antigens are, for example, tumour antigen effectived epitopes recognised by tumour infiltrating lymphocytes (TIL) of HLA (human leukocyte antigen) class I or II. The composition is useful for enhancing immunity in an animal to a disease, by administering a mature dendritic cell comprising CPP associated with an antigen to disease, to the animal, such that following the administration, animal is protected from disease, where the animal comprises both CD4+ and CD8+ I cells. It is also useful for treating a
presenting cells, optionally in vivo), for expression of (I). (I) has a high binding capacity for HLA-A2 and can reverse the usual suppression of the immune response associated with tumor cells. By introducing the nucleic acid that encodes (I) into an antigen-presenting cell in vitro, then returning the cells to the patient, a more certain and controlled response is achieved, compared with administration of the peptide plus
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   invention relates to a composition (I) comprising an immune effector

The invention relates to a nucleic acid vaccine comprising one or more tumour antigen-encoding nucleic acids and one or more cytokine adjuvant-encoding nucleic acids. The tumour antigen encoded by the vaccine is mucin 1 (MUC-1), the kallikreim KLK2, or prostate specific antigen (PSA, also known as KLK3), and the cytokine adjuvant encoded can be interleuking also known as KLK3), and the cytokine adjuvant encoded can be interleuking a specific antigen (PSA, also known as KLK3), and the cytokine adjuvant encoded can be interleuking carefured antigen-encoding nucleic acid is preferably under the control of a promoter such as the cytomegalovirus immediate early promoter, the dihydrofoliate reductase promoter or the carly or late SV40 promoters. The invention also encompasses the method of eliciting an immune response to a tumour antigen in a mammal using the induces a humoral or cellular response to the tumour antigen and adjuvant induces a humoral or cellular response to the tumour antigen, generating an immune reponse useful for treatment or prophylaxis of cancers. The present sequence represents a mucin 1 (MUC-1) polypeptide sequence which
                                                                                                                                                                                                                                                                                                  ö
disease (e.g. cancer, tumour, melanoma, thymoma, lymphoma, sarcoma, lung cancer, non-Hodgkin's lymphoma, leukaemia, Hodgkin's lymphoma, uterine cancer, cervical cancer, bladder cancer, kidney cancer, adenocarcinoma,
                                                            breast cancer, prostate cancer, ovarian cancer and pancreatic cancer). The animal is further subjected to a cancer treatment including surgery, radiation, chemotherapy or gene therapy. The administration of (I), preferably dendritic cell is prior to, subsequent to or concurrent with, the cancer treatment. The present sequence is a tumour antigen derived epitope for inclusion in the composition of the invention

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            The invention comprises a method for identifying a cell that will differentiate into a metastatic cancer cell, the method involves identifying a mutated fibronectin in the cell. The method of the invention is useful for preventing metastatic cancer. The present acid sequence represents a Class I HLA-restricted widely expressed
is specifically claimed for use in the vaccine of the invention

  The present lime interior as a quantic control of the presentation and proposed of the presentation and presentation of antigenic peptides on antigenic presenting cells, where (II) comprising a beta 2-microglobulin molecule that is linked through its carboxyl terminal to a polypeptide stretch which allows the anchorage of the beta 2-microglobulin molecule to the cell membrane, and through its amino terminal to a antigenic peptide comprising major histocompatibility complex (MHC) class I epitope. The antigenic peptide is not related to an autoimmune disease. Also a described: (I) an expression vector (III) comprising (I) and is a recombinant viral vector; (2) an autoimmune viral epitope. The with (I); (3) a DNA vaccine (V) comprising (I) and is a recombinant viral vector; (2) an antigen-presenting cell (IV) transfected with (I); (4) a cellular vaccine (V) for the prevention or treatment of cancer comprising (IV) which express (I) or tumour cells transfected with (I); where the cells have been pulsed with an antigenic peptide derived from one tumour (I) associated antigen; and (5) a pharmaceutical composition (VII) comprising (IV); (III) or (IV) as an active ingredient and carrier. (I) has certivities, and can be used in vaccines, and for inducing cytocoxic T lymphocytes. (I) and (V) can be used for the prevention or treatment of cancer or for a disease caused by a pathogenic organism. (VI) is useful
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  pathogenic antigen. (VI) is also useful for immunising a mammal against a
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    tumour-associated antigen or a disease caused by a pathogenic organism, which involves immunising the mammal with (VI). (I) is useful for
                                       double-chimeric beta 2-microglobulin; antigenic peptide; antigen-presenting cell; beta 2-microglobulin; major histocompatibility complex class I epitope; MHC class I epitope; cytostatic; antibacterial virucide; fungicide; protozoacide; vaccine; cytotoxic T lymphocyte induction; cancer; pathogenic organism; tumour associated antigen; pathogenic antigen.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          present invention describes a double-chimeric beta 2-microglobulin
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Novel double-chimeric beta2-microglobulin polynucleotide useful for treating cancer, comprising sequence encoding polypeptide capable of presentation of antigenic peptides.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   inducing class I-restricted CTL response in a mammal. The present sequence is used in the exemplification of the present invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       organism, where (VI) presents one tumour associated antigen,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       100.0%; Score 49; DB 8; Length 9; 100.0%; Pred.                                                                                                                                                                                                                                                                                                isolated polymucleotide encoding or complementary to an antigenic determinant of a tumour-associated protein and a second isolated polymucleotide encoding or complementary to a nucleic acid adjuvant. The composition further comprises at least one promoter sequence controlling expression of the polymucleotides and a carrier or adjuvant. The promoter polymucleotide is human cytomegalovirus immediate early promoter, dihydrofolatereductase promoter, early SV40 promoter. The tumour-associated protein is prostate specific antigen promoter. The tumour-associated protein is prostate specific antigen encodes human interleukin (IL)-18 IL-12, granulocyte-macrophage colonyetimulating factor or B7-1 or its variant. The first and second polymucleotides are contained in the same or separate nucleic acid
Composition comprising polynucleotide encoding antigenic determinant of tumor-associated protein (eg prostate specific antigen) and nucleic adjuvant (eg interleukin-18) useful for eliciting immune response to cancer associated tumor protein.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             ဌ
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 vectors. The composition is useful in eliciting an immune response cancer associated tumour protein in a mammal. The present sequence represents a human MUC1 polypeptide CTL helper epitope.

                                                                                                                                                                                                                                                                                                                                                                                    New vaccine composition comprises inverted microsomes from animal cells with an externally disposed peptide antigen and a protein of the Major Histocompatibility Complex (MHC), useful for treating or preventing, e.g.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                  The invention comprises a vaccine composition that consists of isolated inverted microsomes from an animal cell (or its membrane fragments), in association with an externally disposed peptide antigen and a protein of the MHC. The vaccine composition of the invention is useful for the prophylaxis or treatment of: infection (e.g. viral, bacterial, yeast, fungal or protozoal), cancer (e.g. melanoma, lung adenocarcinoma, colon cancer, breast cancer or leukemia), autoimmune disease (e.g. multiple scleroais, rheumatoid arthritis or systemic lupus erythematosus). The present amino acid sequence represents a class I HLA-restricted widely

The invention relates to a method of inducing a CTL (cytotoxic T lymphocyte) by contacting a cell line expressing at least one major histocompatibility antigen (MHC) class I molecule, an antigen, and a continuatory molecule, where the cell line is transformed with at least one co-stimulatory molecule or exogenous antigen, with an isolated or purified antigenic peptide and with a lymphocyte for a time and under conditions for inducing a CTL specific for the antigenic peptide. The centing or preventing a CTL specific for the antigenic peptide. The centing or preventing cancer or an infectious disease, e.g. a bacterial, viral, or parasitic infections. The present method provides CTLs having a highly effective treatment also, compared to conventional method, the present method uses a synthetic peptide and thus imposes less burden on the patient. The CTLs induced using the present method are more likely to function specifically to individual disease antigens than the CTLS induced conventionally, thus can be used to stimulate the cytocoxic T-lymphocytes in the method of the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    ö

                                                                                                                                                                                           A synthetic peptide such as p105 (AAR68022) includes 5 tandem repeats of the mucin peptide given in AAR68004. The DTR motif, located between the first 2 prolines of each repeat, is the target of an anti-mucin immune response, and can be substituted by a sequence from a virus, tumor antigen or autoantigen. Drugs based on 9-amino acid portions (AAR68007-21) of the mucin peptide were developed. (Updated on 25-MAR-2003 to correct PN field.)

The immunogenic peptides can bind to a specific HLA allele (i.e. HLA-A subtypes HLA-A2.1, Al, A3.2 or A24.1 or HLA-B or C) and induce a cytotoxic T cell response against the antigen from which the peptide is derived. Cytotoxic T lymphocytes (CTLS) which destroy antigen-bearing cells are normally induced by an antigen in the form of a peptide fragment bound to a HLA molecule, rather than the intact foreign antigen itself, and are particularly important in tuncat foreign antigen itself, and are particularly important in therefore useful therapeutically to treat or prevent viral infections and cancers in mammals (especially humans) e.g. prostate cancer, hepatitis B and C, AIDS, and renal carcinoma. They can be administered as vaccines to elicit an immune response in individuals susceptible or otherwise at risk
                                  cancer in a sample. The assay comprises contacting the sample with a synthetic muc-1 peptide that comprises at least two 20 amino acid tandem repeats of muc-1 and is capable of attaining native conformation in the absence of glycosylation, and detecting any peptide-antibody complex formation. The assay can be used in the diagnosis of e.g. pancreatic, breast or colon cancer. The present sequence represents a mucin peptide
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Immunogenic peptide having a human leukocyte antigen binding motif #1315.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       New immunogenic peptides with HLA binding motif, useful in treatment and diagnosis of cancers and viral diseases.

The activated T cells are produced by treating peripheral blood lymphocytes with liposome-encapsulated beptide antigen to generate Ag-loaded antigen-presenting cells (APC), contacting naive or anergic T-cells with these APC, and isolating the resulting activated T-cells. The cells are specific for a particular antigen, particularly one derived from a tumour, but also those from viruses, bacteria and other parasites. It can also be used to identify antigens and epitopes able to generate an Ag-specific T-cell response (by assessing proliferation and cytckine release). Also the Ag-loaded APC can be used as cellular vaccines for treating cancer (claimed) or other diseases (e.g. malaria, human immune deficiency virus infection, hepatitis, tuberculosis). The activated T-cells can be used to treat the same conditions by adoptive T-cell transfer therapy
of viral infection or cancer, or used to treat chronic or acute conditions. They are also useful diagnostically, and can be used to induce a cytotoxic T cell response, by contacting a cytotoxic T cell with the peptide e.g. to produce CTLs ex vivo for infusion back into a patient. The polynucleotides encoding the immunogenic peptides are also useful therapeutically and for immunisation as above
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 peripheral blood lymphocyte, antigen-presenting cell; APC; virus; tumour;

The patent discloses peptide or polypeptides capable of eliciting an immune response, comprising an amino acid sequence corresponding to an epitope of the non-central portion of varying numbers of an amino acid motif (WNTR), non-leader region of a mucin. The peptides of the invention, fusion proteins comprising the peptide and conjugate compounds with carbohydrate polymers are used to induce a cell mediated immune response against mucin in the prevention or treatment of carcinoms preferably adenocarcinoma, most preferably breast cancer. They are also used to pulse dendritic cell for in vivo transfer and use as a vaccine. They are also used in gene therapy. The present sequence is HIAA-A*0201 T cell epitope from human. This sequence is used for the prediction of T-cell epitopes for the VNTR region
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Immunostimulant peptide, used as an anti-carcinoma vaccine, comprises a an epitope of the non-VWTR, non-leader region of a mucin.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Epitope, tumour antigen; antiviral; immunostimulatory; cervical cancer; human papillomavirus-associated disease; condyloma; cervical dysplasia; cervical dysplasia; major histocompatibility complex; MHC I.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      ð
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     g
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 The present invention relates to microparticles which are less than 20 microns in diameter, which comprise a polymeric matrix, a lipid and a nucleic acid molecule. The microparticle is specifically not encapsulated in a liposome and does not comprise a cell. The nucleotide sequence encodes an expression product that binds to major histocompatibility complex (MHC) type I or II molecules. Peptides ABB33662-B33647 represent MHC class I associated immunogenic peptides, and AAB3368-B33710 represent WHC class I associated immunogenic peptides. The peptides are examples of the expression products of the nucleotide sequences AAB33711-B33716 represent alternative expression products and nuclear localisation signals also used in the invention. The microparticles are useful for administering a nucleic acid into the mucosal tissue preferably vaginal

The present sequence is that of a peptide of the invention. The invention relates to a method for scalable, continuous flow production of a nucleic acid containing microparticle that maintains the structural integrity of the associated nucleic acid and results in a microparticle having purity suitable for introduction into an animal host. Microparticles prepared according to the method can be used for delivery of a nucleic acid for gene therapy, antisense therapy, vaccination, treatment of autoimmune disease and either specific or non-specific modulation of an immune response. The microparticles may also be used to deliver nucleic acid encoding a protein or peptide useful in any kind of therapy. The method is economical, aseptic and scalable. The method also enables control over the size of microparticles. The microparticles produced are free of impurities such as organic solvents and are readily dispersed in a wide range of dispersing agents
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            WUC1; mucin; anti-MUC1; epitope; human; detection; immunogenic; antibody;
                                                                                                                                                                                                                                                                                                                                                                                                                                           Continuous production of microparticles containing nucleic acid for e.g. gene therapy, comprises mixing a solution of polymeric material and nucleic acid with a surfactant solution, removing solvent and drying.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           .

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              This invention relates to polynuclectides encoding a hybrid polypeptide comprising a signal sequence and three segments that are either contiguous or separated by a spacer amino acid or spacer peptide. The contiguous or separated by a spacer amino acid or spacer peptide. The invention specifically details polynucleosing a polyepitope peptide where the peptide segments are tumour antigens or a naturally occurring protein of a pathogenic agent. The polymucleotide and polymucleotide and polyepitope peptides are useful for eliciting an immune response in a mammal. The polynucleotide and protein are useful as vaccines for treating tumours and pathogenic infections. The polynucleotide is also useful for preventing or treating human papillomavirus (HPV)-associated diseases, particularly exophytic condyloma, flat condyloma, cervical cancer, respiratory papilloma, conjunctival papilloma, genital-tract HPV infection, cervical dysplasia, high grade squamous intraepithelial lesions, and anal HPV infection. The polynucleotide and polypeptide are useful for generating prophylactic or therapeutic immune
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               response against pathogens, tumours or autoimmune diseases in a population of individuals having diverse MHC allotypes, as positive controls in Teall stimulation assays in vitro, and as tools to understand processing of epitopes within cells. Peptides AAB95894 - AAB96037 and AAB96048 represent major histocompatibility complex I (MHC I) associated tumour and pathogen antigens. The peptides can be used as part of the polyepitope proteins of the invention. Also included are examples of the polyepitope proteins represented by AAB96050 - AAB96052, and localisation signal peptides AAB96038 - AAB96043 and AAB96049 which can be used in the construction of the polyepitope
                                                                                                                                                                                                                                                                                                                                                                                           Novel nucleic acids encoding polyepitope polypeptides containing multiple epitopes from one or more proteins, useful for treating tumors and as vaccines against pathogenic agents.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Gaps

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   ò
                                                                                                                                                                 This invention describes a novel method for detecting a molecule (1) in a solution which involves coupling another molecule (2) with a dye, selecting the net charge in the solution of molecule to be opposite to and less than that in the solution of molecule (1), adding dye-labelled molecule (2) to molecule (1), applying an electric field and detecting the dye at the anode or cathode (depending on the charge). The invention also describes a method for detecting a third molecule (2) in a solution which can bond to molecule (1) and to a second molecule (2) by coupling dye to (2) and selecting the net charge as above, forming a solution which can be detected at the cathode if the net charge in the solution is negative or at the anode if the net charge is positive. This sequence represents an immunogenic fragment of human MUCI containing an epitope which is used to raise anti-MUCI antibodies, used in screening cathor the anomal character the method described in the invention. The simple and reliable method for the detection of certain molecules (e.g. anti-MUCI antibodies or tumor-size than that of

The invention relates to a composition (I) comprising an immune effector cell and a cell penetrating peptide (CPP) associated with an antigen or antibody. Also included are (I) a vaccine comprising (I). CPP associated with an antigen, and a pharmaceutically acceptable carrier and (2) preparing a composition for a disease, by providing (I) and CPP associated with an antigen for disease, and introducing the antigeneracy of associated with an antigen for disease, and introducing the antigeneracy for example, tumour antigen enters into the cell. The antigens are, for example, tumour antigen derived epitopes recognised by tumour infiltrating lymphocytes (TLL) of HLA (human leukocyte antigen) class I or II. The composition is useful for enhancing immunity in an animal to a disease, by administering a mature dendritic cell comprising CPP associated with an antigen to disease, to the animal, such that following continuous animal is protected from disease, where the animal comprises both CD4+ and CD8+ T cells. It is also useful for treating a disease (e.g. cancer, tumour, melanoma, thymoma, lymphoma, sarcoma, lung cancer, non-Hodgkin's lymphoma, leukaemia, Hodgkin's lymphoma, sarcoma, lung cancer, nor-Hodgkin's lymphoma, leukaemia, Hodgkin's lymphoma, sarcomer, breast cancer, breast cancer, breast cancer, walation, chemotherapy or gene therapy. The administration of (I).

The animal is further subjected to a cancer treatment including surgery, crediation, chemotherapy or gene therapy. The administration of (I).

The animal is further subjected to a cancer treatment including engage the cancer content of the cancer treatment. The present sequence is a tumour antigen derived content of the cancer treatment. The present sequence is a tumour antigen derived content of the cancer included to a cancer of the cancer of t

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   ઠ
                                                                                                                                                                       The present invention relates to novel T-cell binding ligand (TCBL)

peptides (e.g. peptide G' (modified human MHC class II beta chain peptide
G, peptide J (human beta-2-microglobulin peptide) and HIV-1 peptides) and
TCBL peptide J (human beta-2-microglobulin peptide) and HIV-1 peptides and
TCBL peptide constructs for treating immunological disorders. The peptide
constructs are useful for eliciting a cellular immune response in a human
patient. The method comprises administering the peptide construct to the
peptide constructs in the form of conjugated peptides are useful for
c peptide constructs in the form of conjugated peptides are useful for
eliciting a cellular immune response in a patient exposed to or at risk
for exposure to the human immunodeficiency virus (HIV). The TCBL peptides
are useful for treating a patient suffering from an immunological
disorder such as herpes simplex virus (HSV) infection, malaria,
c alergies, autoimmune diseases (e.g. arthritis, Graves disease, multiple
sclerosis (MS), autoimmune myocarditis, diabetes and lupus) by
anliergide associated with the disorder. Unlike prior art peptide
conjugates, a modified version of peptide G has long range stabilisation
and also enhances the immune response. AAU82019-AAU82114 represent T-cell
peptide constructs or peptides used in
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 ö
                                                                                     New T cell binding ligand peptide for treating immunological disorders such as herpes simplex virus, tuberculosis, cancers, acquired immunodeficiency syndrome and allergies.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Nucleic acid vaccine; DNA vaccine; tumour antigen; cytokine adjuvant; humoral response; cellular response; immune response; immunotherapy; cancer; cytostatic; vaccine; gene therapy; mucin 1; MUC-1; cytoctoxic T lymphocyte; CTL epitope.

the inversion relates to a flucter and watche completing on or more cutokine adjuvant tumour antigen-encoding nucleic acids and one or more cytokine adjuvant encoding nucleic acids. The tumour antigen encoded by the vaccine is mucin | I MMC-1), the kallikrain KLK2, or prostate specific antigen (BSA, also known as KLK3), and the cytokine adjuvant encoded can be interleukin or especially interleukin-18 (IL-18). The antigen-encoding nucleic acid is preferably under the control of a promoter such as the cytomegalovirus immediate early promoter, the dihydrofoliate reductase promoter or the carly or late $V40 promoters. The invention also encompasses the method of eliciting an immune response to a tumour antigen and adjuvant induces a humoral or cellular response to the tumour antigen and adjuvant induces a humoral or cellular response to the tumour antigen, generating an immune reponse useful for treatment or prophylaxis of cancers. The presents as mucin 1 (MUC-1) polypeptide sequence which is specifically claimed for use in the vaccine of the invention.
New nucleic acid vaccine, useful for eliciting an immune response to a
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Microparticle; microsphere; polynucleotide delivery; phagocytic cell; tumour; viral infection; bacterial infection; fungal infection; protozoan infection; gene therapy; major histocompatability complex;

                                                                                                                                                                                                                                                                                                                                                           ö
                                                                            The invention relates to a microparticle (microsphere) less than 20 microns in diameter that comprises: (1) a polymeric matrix; (2) a lipid; and (3) a nucleic acid molecule. The microparticle is not encapsulated in a liposome and the microparticle does not comprise a cell. The microparticles are used as vehicles for the delivery of polymucleotides into phagocytic cells. The microparticles can be used to express antigens to treat tumour cells or viral, bacterial, fungal or protozoan infections. The microparticles can be made without adversely affecting nucleic acid integrity. The present sequence represents the amino acid sequence of a major histocompatability complex, MHC, class I associated
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Identifying a cell that differentiates into a metastatic cancer cell, useful for preventing metastatic cancer, comprises identifying a mutated fibronectin in the cell.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     amino
phagocytic cells, comprises polymeric matrix, lipid, and nucleic acid
                                                                                                                                                                                                                                                                                                                                                           Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            The invention comprises a method for identifying a cell that will differentiate into a metastatic cancer cell, the method involves identifying a mutated fibronectin in the cell. The method of the invention is useful for preventing metastatic cancer. The present acid sequence represents a Class I HLA-restricted widely expressed

The vaccine of the invention may be useful for prevention and treatment of cancers including melanoma, sarcoma, lymphoma (Hodgkins or non-Hodgkins), lenkaemia, neuroblastoma, myeloma and cancer of the lung, stomach, skin, thyroid, ovary, prostate, womb, pancreas, colon, bladder, breast, oesophagus, kidney or brain. The current sequence is that of a genetic vaccine/ubiquitin (Ub)/MUC1-related epitope peptide of the invention.
                                                                                                                                                                                                                                                                                                                                                                 Genetic vaccine/ubiquitin (Ub)/MUC1-related epitope peptide - SEQ ID 181.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Gene vaccine containing cancer antigen genes ligated to ubiquitin genes
                                                                                                                                                                                                                                                                                                                                                                                                             vaccine, ubiquitin; Ub; T-cell target; melanoma; sarcoma; Hodgkins lymphoma; non-Hodgkins; leukaemia; neuroblastoma; myeloma; lung cancer; stomach; skin; thyroid; ovary; prostate; womb; pancreas; colon; bladder; breast; osesphagus; kidney; brain; epitope; MUC1.

polynucleotide encoding or computer process.

composition further comprises at least one promoter sequence controlling expression of the polynucleotides and a carrier or adjuvant. The promoter polynucleotide is human cytomegalovirus immediate early promoter. The promoter of promoter. The tumour-associated protein is prostate specific antigen promoter. The tumour-associated protein is prostate specific antigen (PSA), kallikrain-2 (KLK2) or mucin-1 (WUC1). The nucleic acid adjuvant encodes human interleukin (IL)-18 II-12, granulocyte-macrophage colonystimulating factor or B7-1 or its variant. The first and second polynucleotides are contained in the same or separate nucleic acid vectors. The composition is useful in eliciting an immune response to a

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    The invention comprises a vaccine composition that consists of isolated inverted microsomes from an animal cell (or its membrane fragments), in sesociation with an externally disposed peptide antigen and a protein of the MHC. The vaccine composition of the invention is useful for the prophylaxis or treatment of: infection (e.g. viral, bacterial, yeast, fungal or protozoal), cancer (e.g. melanoma, lung adenocarcinoma, cancer, breast cancer or leukemia), autoimmune disease (e.g. multiple sclerosis, rheumatoid arthritis or systemic lupus erythematosus). The present amino acid sequence represents a class I HLA-restricted widely
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Immunosuppressive; microparticle; gene therapy; antisense therapy; vaccination; autoimmune disease; MHC Class I.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 ..

This Brightner represents an antiquanto period caracterized by a variable community of an antiquanto period caracterized by a variable of period unit given in Aze6304. WCI fragments may be used as compared to the method of the invention for treatment of breast cancer. Immunogen in the method of the invention for treatment of breast cancer. The method comprises the administration of a combination of an anti-carrogenic steroid and an immunological agent (B) (effective to contribute to the development of a protective immune carefords to the breast cancer; where (A) and (B) are therspeutically effective to contribute to the development of a protective immune core immunogen comprising at least one breast cancers. (B) comprises at least one immunogen comprising at least one breast cancers. (B) comprises at least one immunogen comprising at least one area of a pout 7 %: The anticatrogen comprises the immunogen comprises STM (A) and (B) are the farged comprises at least one stronglute thaving a NANA content of about 7 %: The anticatrogen comprises at least one area of a least one area of a learn one (seroidal non-seroidal) anticatrogen; where the character of an anticatrogen is full valentant and the non-seroidal anticatrogen of a composition of a learn one progestin (progesterone) that protects against breast cancer; an east one anti-progestin (progesterone) that protects against breast cancer; and at least one progestin (progesterone) that protects against breast cancer in a subject who is receiving on the reatment of preast cancer in a subject who is receiving on has received treatment with an anti-cancer of a composition for the treatment of preast cancer in a subject who is receiving to the service of a composition for the treatment of a protective immune cepones to the breast cancer in the subject; (A) is useful in the anti-cancer hormone had better time to disease progression (IDD) alone.

C) the combina

[1] is used for delivery of a nucleic acid for gene therapy, antisense therapy, vaccination, treatment of autoimmune disease, and either specific or non-specific modulation of an immune response (e.g. via cytokine regulation). The scalable, continuous flow production of [1] maintains the structural integrity of the associated nucleic acid and results in a microparticle having a purity introduction into an animal (e.g. human) host. The cytokine contains encessary for research, for producing a microparticle in amounts necessary for research, continuous flow process contains stable, active, potent, structurally intact nucleic acid, e.g. as supercoiled DNA. The method also provides efficient encapsulation of the nucleic acid in the microparticle and allows for efficient recovery of the microparticle. The current sequence represents an MHC class I associated tumor and pathogen poptide sequence. This sequence could be an expression product of a microparticle of the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     ö
                                                                                                                                                                                                                                                                                                                          Scalable continuous preparation of nucleic acid-containing microparticles to treat autoimmune disease comprises solvent removal device and mixing chamber; and continuously supplying first emulsion and second aqueous solution to the chamber.

```
A synthetic peptide such as p105 (AAR68022) includes 5 tandem repeats of the mucin peptide given in AAR68004. The DTR motif, located between the first 2 prolines of each repeat, is the target of an anti-mucin immune response, and can be substituted by a sequence from a virus, tumor antigen or autoantigen. Drugs based on 9-amino acid portions (AAR68007-21) of the mucin peptide were developed. (Updated on 25-MAR-2003 to correct PN field.)
                                                                         Mucin; multiple tandem repeat; vaccine; pancreas cancer; breast cancer; ovary cancer; colon cancer; HIV.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Mucin, multiple tandem repeat; vaccine; pancreas cancer; breast cancer;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Synthetic multiple tandem repeat mucin-1 peptides and analogues - have native conformation in the absence of glycosylation and are linked to epitopes; for vaccines and tests of cancer, viruses and bacteria.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            1; Indels

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        ô
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Peptides AAW67583-W67611 are used to produce activated T helper (CD4+) and cytotoxic (CD8+) T-cells. The activated T cells are produced by treating peripheral blood lymphocytes with liposome-encapsulated beptide antigen to generate Ag-loaded antigen-presenting cells (APC), contacting activated T-cells with these APC, and isolating the resulting activated T-cells. The cells are specific for a particular antigen, particularly one derived from a tumour, but also those from viruses, bacteria and other parasites. It can also be used to identify antigens and epitopes able to generate an Ag-specific T-cell response (by assessing proliferation and cytchine release). Also the Ag-loaded APC can be used as cellular vaccines for treating cancer (claimed) or other
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Method of activation of T cells - by exposure to antigen-presenting cells loaded with antigen in liposome, used for, e.g. treating cancer and microbial infections.
                                                                                                                                                                                                                      Activated T helper cell; CD4+; cytotoxic T cell; CD8+; liposome; epitope; peripheral blood lymphocyte; antigen-presenting cell; APC; virus; tumour; bacterium; parasite; cytokine; vaccine; cancer; malaria; HIV; hepatitis;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               diseases (e.g. malaria, human immune deficiency virus infection, hepatitis, tuberculosis). The activated T-cells can be used to treat the same conditions by adoptive T-cell transfer therapy
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                73.5%; Score 36; DB 2; Length 9; 66.7%; Pred. Assay for cancer antibodies - using synthetic peptide comprising multiple
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           An assay has been developed for antibodies to pancreatic, breast or colon cancer in a sample. The assay comprises contacting the sample with a synthetic muc-1 peptide that comprises at least two 20 amino acid tandem repeats of muc-1 and is capable of attaining native conformation in the absence of glycosylation, and detecting any peptide-antibody complex formation. The assay can be used in the diagnosis of e.g. pancreatic, breast or colon cancer. The present sequence represents a mucin peptide
the mucin peptide given in AAR68004. The DTR motif, located between the first 2 prolines of each repeat, is the target of an anti-mucin immune response, and can be substituted by a sequence from a virus, tumor antigen or autoantigen. Drugs based on 9-amino acid portions (AAR68007-21) of the mucin peptide were developed. (Updated on 25-MAR-2003 to correct PN field.)
                                                                                                                                                                                                                                                                                                                                                                                                              Mucin, muc-1, human; cancer; infectious disease; vaccine; diagnosis; multiple tandem repeat; pancreatic cancer; breast cancer; colon cancer.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     1; Indels

                                                                                                                                                                                                                                                                                                                                                                                                    ö
                                                                                                                                                                                                                 A synthetic peptide such as p105 (AAR68022) includes 5 tandem repeats of the mucin peptide given in AAR68004. The DTR motif, located between the first 2 prolines of each repeat, is the target of an anti-mucin immune response, and can be substituted by a sequence from a virus, tumor antigen or autoantigen. Drugs based on 9-amino acid portions (AAR68007-21) of the mucin peptide were developed. (Updated on 25-MAR-2003 to correct PN field.)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       A synthetic peptide such as p105 (AAR68022) includes 5 tandem repeats of

```
Assay for cancer antibodies - using synthetic peptide comprising multiple tandem repeats of muc-1.
                                                                                                                                                                                                                                                                                                                                  cancer in a sample. The assay comprises contacting the sample with a synthetic muc-1 peptide that comprises at least two 20 amino acid tandem repeats of muc-1 and is capable of attaining native conformation in the absence of glycosylation, and detecting any peptide-antibody complex formation. The assay can be used in the diagnosis of e.g. pancreatic, breast or colon cancer. The present sequence represents a mucin peptide
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Immunostimulant peptide, used as an anti-carcinoma vaccine, comprises an epitope of the non-VNTR, non-leader region of a mucin.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Gaps

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           An assay has been developed for antibodies to pancreatic, breast or colon
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 cancer antibodies - using synthetic peptide comprising multiple
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            cancer in a sample. The assay comprises contacting the sample with a synthetic muc-1 peptide that comprises at least two 20 amino acid tandem repeats of muc-1 and is capable of attaining native conformation in the absence of glycosylation, and detecting any peptide-antibody complex formation. The assay can be used in the diagnosis of e.g. pancreatic, breast or colon cancer. The present sequence represents a mucin peptide preparation from the present invention
                                                                                                                                                                                   Mucin; muc-1; human; cancer; infectious disease; vaccine; diagnosis; multiple tandem repeat; pancreatic cancer; breast cancer; colon cancer.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Mucin; muc-1; human; cancer; infectious disease; vaccine; diagnosis; multiple tandem repeat; pancreatic cancer; breast cancer; colon cancer.

The invention relates to a novel genetic vaccine containing the ubiquitin gene together with a gene encoding an antigenic protein containing a Teleal target sequence. The vaccine of the invention may be useful for prevention and treatment of cancers including melanoma, sarcoma, lymphoma (Hodgkins or non-Hodgkins), leukaemia, neuroblastoma, myeloma and cancer of the lung, stomach, skin, thyroid, ovary, prostate, womb, pancreas, colon, bladder, breast, oesophagus, kidney or brain. The current sequence is that of a genetic vaccine/ubiquitin (Ub)/MUC1-related epitope peptide of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Genetic vaccine/ubiquitin (Ub)/MUC1-related epitope peptide - SEQ ID 182.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Gene vaccine containing cancer antigen genes ligated to ubiquitin genes or cytokine genes for prevention and treatment of cancer.

                                                                                                                                                                                                                                                                                                                                                                                       ö
The patent discloses peptide or polypeptides capable of eliciting an epitope of the non-central portion of varying numbers of an amino acid sequence corresponding to an epitope of the non-central portion of varying numbers of an amino acid motif (VNTR), non-leader region of a mucin. The peptides of the invention, fusion proteins comprising the peptide and conjugate compounds with carbohydrate polymers are used to induce a cell mediated immune response against mucin in the prevention or treatment of carcinoma, preferably adenocarcinoma, most preferably breast cancer. They are also used to pulse dendritic cell for in vivo transfer and use as a vaccine. They are also used in gene therapy. The present sequence is a VNTR peptide of mucin-1 (MUC-1) protein from human
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   The invention relates to a novel genetic vaccine containing the ubiquitin gene together with a gene encoding an antigenic protein containing a T-cell target sequence. The vaccine of the invention may be useful for prevention and treatment of cancers including melanoma, sarcoma, lymphoma (Hodgkins or non-Hodgkins), leukaemia, neuroblastoma, myeloma and cancer of the lung, stomach, skin, thyroid, ovary, prostate, womb, pancersa, colon, bladder, breast, ossophagus, kidney or brain. The current sequence is that of a genetic vaccine/ubiquitin (Ub)/MUC1-related epitope peptide
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Genetic vaccine/ubiquitin (Ub)/MUC1-related epitope peptide - SEQ ID 194
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Gene vaccine containing cancer antigen genes ligated to ubiquitin genes or cytokine genes for prevention and treatment of cancer.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    vaccine; ubiquitin; Ub; T-cell target; melanoma; sarcoma; Hodgkins lymphoma; non-Hodgkins; lettkeemia; neuroblastoma; myeloma; lung cancer; stomach; skin; thyroid; ovary; prostate; womb; pancreas; colon; bladder; breast; oesophagus; kidney; brain; epitope; MUCI.
                                                                                                                                                                                                                                                                                                                                                                                     Gaps

The invention relates to new therapeutic compositions, which comprise a binding agent that specifically binds to an epitope of a tumour-case associated mucin-1 (MCUZ), are effective for treating a mammal bearing a tumour. Mice were implanted with 413ECR tumour cells 2 weeks after the start of the immunisation series (using either a conjugate of the binding agent. MUCI). It was found that a humoral response was induced in mice treated with both the conjugated and complexed binding agent. A T cellular response to the binding agent was complexed binding agent was a nice treated with the conjugated or complexed binding agent was also demonstrated. The therapeutic compositions or the method is useful for treating a mammal (particularly a human) bearing a tumour, especially a tumour that expresses a tumour-associated MUC-1. In particular, the compositions are useful for treating adenocarcinomas, e.g. breast carcinoma, colon carcinoma, oesophageal squamous cell carcinoma. The particular the continual the model of the model 
                                                                                                                                                                                                                                                                                                                                                                                                      New therapeutic compositions comprising a binding agent that binds to tumor-associated MUC1 epitope, useful for treating human tumors, e.g. breast carcinoma, prostate carcinoma or multiple myeloma.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Human, cancer; breast cancer; ovarian cancer; melanoma; cell therapy; epitope; human leucocyte antigen; HLA-A2.1.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               present sequence represents the mucin-1 associated epitope
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Human HLA-A2.1 restricted MUC-1 (mucin) peptide epitope.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        8
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        The invention relates to a novel genetic vaccine containing the ubiquitin gene together with a gene encoding an antigenic protein containing a Telel target sequence. The vaccine of the invention may be useful for prevention and treatment of cancers including melanoma, sarcoma, lymphoma (Hodgkins or non-Hodgkins), leukaemia, neuroblastoma, myeloma and cancer of the lung, stomach, skin, thyroid, ovary, prostate, womb, pancreas, colon, bladder, breast, oesophagus, kidney or brain. The current sequence is that of a genetic vaccine/ubiquitin (Ub)/MUC1-related epitope peptide of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Gene vaccine containing cancer antigen genes ligated to ubiquitin genes or cytokine genes for prevention and treatment of cancer.

                                                                                                                                                                                                                                                                                                                                                                                           1;
                                                                                                                                                                 The invention relates to a method of treating a subject with cancer. The mathod involves combining the CD+8 cells, which are stimulated with non naturally occurring antigen-presenting cell (mAPC) line, with adherent blood monocytes and inoculating the subject with CD8+ suspension. The method is useful for treating cancer e.g. ovarian cancer, breast cancer and melanoma etc. It is also useful in cell therapy. The present sequence is human leukocyte antigen A2 (HLA-A2).1 restricted peptide epitope used
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 invention relates to a novel method for treating viral infection in a
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 subject. The method comprises preparing an antigen presentation cell lineage (nnAPC), collecting CD8+ cells from the subject, stimulating CD8+ cells using the nnAPC, culturing CD8+ cells in the presence of interleukin-2 (IL-2) and/or IL-7, mixing peripheral blood monocytes from the subject; subjecting the components to gamma irradiation, combining the CD8+ cells with adhesive peripheral blood monocytes and inoculating
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Treating a subject with cancer comprises combining the CD+8 cells, which are stimulated with non-naturally occurring antigen-presenting cell line, with adherent blood monocytes and inoculating the subject with CD8+

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     chimeric peptide, comprising at least 2 tandemly repeated units, where the 1st portion of the repeated unit comprises a human mucin 1 (MUC1) sequence which forms an extended connector and a base of a loop structure of human MUC1, and a 2nd portion comprising an immunoglobulin super family protein Omega loop sequence. In the peptide, the natural structure of MUC1 tandem repeats can be used to present an Omega loop sequence in a functional conformation that is both multivalent and biologically active. It can provide prophylactic and therapeutic agents which have the binding specificity of an immunoglobulin super family member protein but do not have the entire protein's backbone. It can be used to neutralise
the CD8+ suspended solid to the subject. The method of the invention demonstrates virucide and cytostatic activities and may be useful for treating a viral infection or tumor in a subject via cell therapy. The current sequence is that of a human MUC-1 cytotoxic T-lymphocyte epitope peptide of the invention which was incorporated into a Drosophila antigen presenting cell.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              New multivalent chimeric peptide(s) for neutralising pathogenic microbes - comprising a loop structure of human mucin 1 and an omega loop of an immunoglobulin superfamily protein.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Multivalent chimeric peptide; tandem repeat unit; human; mucin 1; MUC1; Omega loop sequence; prophylaxis; therapy; pathogenic virus neutralisation; human immunodeficiency virus; HIV.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               The present sequence was used in the development of a novel multivalent

Tumour associated antigen peptides (1AAA) may De used for the treatment, breast, bladder, prostate, pancreas, ovary, thyroid, colon, stomach, head breast, bladder, prostate, pancreas, ovary, thyroid, colon, stomach, head or neck cancer or a carcinoma. The tumour associated antigens are presentable to the immune system by HLA-A2 molecules and are generally between 8 to 10 amino acids in length. The amino acids located at positions 2 and 9 of the tumour associated antigens are the anchor residues which participate in the binding to MHC class I molecules, more specifically HLA-A2. More tumour associated antigens are described in GENESEQ records AAY82806-Y82882. Those tumour associated antigens (specifically HLA-A2. More tumour associated antigens are described in central and AAY82805-Y82859 are derived from Uroplakin is cuch as Uroplakin in Uroplakin II and Uroplakin is cuch as Uroplakin in records AAY82806. Those described in records AAY82840-Y82884 are derived from Lactadherin (BA-46). Those described in records AAY8281-Y82884 are derived from Mucin and those described in records AAY8281-Y82884 are derived from Mucin and those described in records AAY82891-Y82882 are derived from Lactacherinoma derived growth factor (CRIPTO-1)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Human, MUC1; antigenic peptide; major histocompatibility complex; MHC-1;
glycoprotein; cytotoxic T lymphocytes; T cell response; cancer; vaccine;

                                                                                                                                                                                                                                                                                                                                                                                                          The sequence represents a human MUC1 polypeptide derivative. Derivative antigenic peptides of MUC1 protein bind at least one major histocompatibility complex class I (MHC-1) glycoprotein, which activates cytocoxic T lymphocytes to induce a protective response against tumours. Diagnosis of cancer involves determining the presence or absence in a chost cell of MHC class I restricted T cell response to a MUC1 derivative, where the presence of the MHC class I restricted T cell response in a cancer. Measurement of the level of MHC class I restricted T cell response is also useful to monitor the severity of cancer, a larger response indicating a more severe cancer. MUC1 cancer, a larger response indicating a more severe cancer. MUC1 cancer therapy and to follow MUC1 specific immune responses in patients during the course of disease and/or treatment. MUC1 DNA is useful in cancer therapy and to follow MUC1 specific cimmune responses in patients during the course of disease and/or treatments against cancer or diseases caused by an immune response, such as an inflammatory disorder, organ transplant rejection or graft versus

Stimulation of immune system involves administration of immunostimulatory molecule comprising at least one oligonucleotide strand having at least one nucleotide sequence and at least one covalently incorporated lipophilic group.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             The invention relates to a novel method for stimulating an immune system. The method involves administering an immunostimulatory modecule of covalently lipidated oligonucleotides comprising the CpG dinucleotide unit, or an analogue. The method of the invention has immunostimulant extivity. The invention is useful in the manufacture of a composition immunostimulating a subject. The present sequence is used in the exemplification of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       glycolipopeptide, cytostatic, antibacterial, virucide, antiparasitic, vaccine, gene therapy, immunotherapeutic, cancer, cross-reactive epitope; immune response, parasite, MUC1.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Gaps

The invention relates to a novel non-naturally occurring glycolipopeptide comprising at least 5 amino acids, at least one amino acid being a glycosylated amino acid and at least one amino acid being a lipidated amino acid, where at least one lipidated amino acid, where at least one lipidated amino acid, is an interior amino acid, the glycolipopeptide comprising at least one disease-associated acid, the glycolipopeptide comprising at least one disease-associated virucide, and antiparasitic activity, and may have a use as a vaccine, and in gene therapy. The glycolipopeptide is useful as an immunotherapeutic or as a vaccine against cancers and pathogens (e.g.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             microbes, toxins, parasites or viruses) presenting cross-reactive epitopes, or as diagnostic reagents. The lipidated amino acid is useful for specific modulation of immune responses to an antigen. The present
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               ror specific modulation of immune responses to an antigen. The present
sequence is used in the exemplification of the invention.

Use of synergistic combination of anti-estrogenic steroids and immunological agents to treat breast cancer.

Disclosure; SEQ ID NO 5; 103pp; English

breast cancer-associated epitope. The immunogen comprises STD (an STD-comprise at a least one epitope is a MUCI epitope or a carbohydrate epitope. The immunogen comprises STD (an STD-comprise that is an aggregated conjugate having a NAMA content of about 7 %). The antiestrogen comprises at least one (steroidal/non-steroidal) antiestrogen; where the steroidal antiestrogen is toremifiene, tamoxifen, droloxifene or trioxifene. The anti-estrogen is toremifiene, tamoxifen, droloxifene or trioxifene. The anti-estrogenic steroid agent comprises at least one aromatase inhibitor (aminoglutethimide, anastrozole, vorozole, letrozole, liarozole, megestrol, exemestane or formestane), preferably geselin acetate or megestrol acetate. The method further comprises the administration of: at least one progestin (progesterone) that protects against breast cancer; at least one progestin (progesterone) that protects cancer; and at least one chemotherapeutic agent other than an antiprogenic steroid agent, where the chemotherapeutic agent is an This sequence represents an antigenic peptide derived from MUC1. MUC1 is a polymorphic antigen characterized by a variable number (typically 21-, 125, esp. 41 or 85) of perfect and imperfect repeats of peptide unit given in ADZ66304. MUC1 fragments may be used as immunogens in the method of the invention for treatment of breast cancer. The method comprises the administration of a combination of an anti-estrogenic steroid agent (A) (effective to reduce the level/activity of at least one estrogenic steroid) and an immunological agent (B) (effective to contribute to the development of a protective immune response to the breast cancer; where (A) and (B) are therapeutically effective against at least some breast cancers. (B) comprises at least one immunogen comprising at least one manufacture of one or more compositions for the treatment of breast cancer. (B) is useful in the manufacture of a composition for the treatment of breast cancer in a subject who is receiving or has received treatment with an anti-estrogenic steroid agent, effective to reduce the level or activity of at least one estrogenic steroid in the subject. (A) is useful in the manufacture of a composition for the treatment of breast cancer in a subject who is receiving or has received treatment with an immunological agent, effective to contribute to the development of a protective immune response to the breast cancer. The combination of (A) and (B) is symergistically effective against breast cancer. The anthracycline (doxorubicin, daunorubicin, epirubicin or idarubicin) or a taxane (paclitaxel or docetaxel). The combination of (A) and (B) is useful to treat breast cancer (metastatic breast cancer) and in the combination of (A) and (B) is effective in the treatment of cancer. The synergistic effect of the combination of (A) and (B) to treat breast cancer was tested in patients. The results showed that the patients treated with the immunogen and the anti-cancer hormone had better time disease progression (TDP) and survival outcome when compared to groups treated with (A) or (B) alone.

Antigenic peptide derived from a human MUC1 protein.

MUC1; epithelial cell mucin; tumour; MUC1 ligand; cancer. Synthetic.

Homo sapiens.

WO200077031-A2

```
The present sequence represents a peptide derived from a human MUC1 protein. MUC1 is an epithelial cell mucin, which is found on, and shed from, the surface of many tunnours. The specification describes ligands that bind to MUC1. These ligands were isolated using a phage display technique using MUC1 tandem repeats as the target. The MUC1 tandem target repeats of the peptide AAB3128s The ligands are useful for detecting the presence of MUC1 in a sample, to treat or prevent cancer associated with MUC1 and to prepare a medicament or diagnostic agent to treat, prevent or detect cancer associated with MUC1. By assaying for the binding between the MUC1 ligand and MUC1 in a sample diagnosis or monitoring of cancer can be carried out. The ligands may also be used to prepare antibodies
                                                                                                                                                                                                                                                          Novel ligands that binds to MUC1, an epithelial cell mucin, useful for diagnosing, monitoring, treating and preventing cancer.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                61.2%; Score 30; DB 4; Length 8; 71.4%; Pred.
